Documentation:

This program receives a string input via command line through argv[]. The number of arguments must be two. The program parses the string argument by finding the first letter and continues through till a delimiter (this the word), this word is then malloc-ed into a struct and added into a linked list sorted. The program repeats until it reaches the null byte of the argument. Repeated words only have their very first instance printed, other instances are ignored.The linked list is finally printed displaying the string sorted alphabetically.
